

VEKTRUM

Conditional authorization infrastructure for construction disbursements.

Enforce release conditions before capital moves. Vektrum determines whether a disbursement is authorized — not whether it executes.

10

Server-side release
conditions

2 rails

Stripe Connect +
external/manual

Hash-chain

Append-only audit log

— THE PROBLEM

Construction capital movement is governed by habit, not enforcement.

Draw releases are fragmented across contracts, SOVs, lien waivers, change orders, evidence, and approvals. The moment money moves is the moment risk crystallises — and there is no enforcement layer between approval and disbursement.

Releases happen before conditions are met

Draw approvals live in email threads, PDFs, and spreadsheets. Conditions are checked by memory — not by enforcement. Premature and duplicate releases are routine.

Missing lien waivers, unresolved change orders

Conditional lien waivers, open change orders, and unsigned contracts routinely slip through release approvals. There is no enforcement layer that checks them before funds move.

Weak audit trails, unclear authority

Who approved what, under what conditions, and on what evidence? There is no authoritative record. When a release is disputed, the answer is emails, memory, and PDFs.

— THE INSIGHT

The industry does not need another workflow tool.

ALREADY SOLVED

Tracking drafts. Managing documents. Routing approvals. Storing files. Dashboards.

STILL UNSOLVED

Enforcement at the moment of release. A server-side answer to a single question —

“Is this release actually allowed right now?”

Most systems track construction payments. Vektrum controls whether they are allowed to move.

— RELEASE WORKFLOW

Contract to authorization.

Every draw follows the same governed path — from DocuSign contract execution through evidence and AI pre-review to the authorization signal that unlocks disbursement.

- VEKTRUM LAYER
- PARTNER / EXTERNAL

01 **Contract uploaded**
Construction contract uploaded to the deal.

03 **Schedule of Values** v
SOV created and approved, linking contract value to milestones.

05 **Evidence + lien waiver** v
Inspection reports, photos, draw request, and conditional lien waiver attached.

07 **Release Readiness gate** GATE
All 10 conditions evaluated server-side. Block or pass — no bypass.

09 **Execution rail**
Stripe Connect automated or partner-controlled external rail executes.

02 **DocuSign executed** v
Both parties sign via DocuSign. Signed contract required before any release.

04 **Milestone linked to SOV** v
Draw request tied to an approved SOV line item.

06 **AI Draw Control Brief** v
AI pre-screens completeness and flags risk before the gate runs.

08 **Funder authorizes** v
Funder-triggered only. Authorization signal recorded with proof.

10 **Audit trail** v
Every action, actor, and proof permanently recorded in hash-chained log.

— THE SOLUTION

A release-control layer between approval and disbursement.

Vektrum does not move money. It determines whether money is authorized to move. From DocuSign contract execution through SOV, evidence, lien waivers, and AI pre-review — then the 10-condition gate decides. Execution happens through Stripe Connect or the partner's existing process. Vektrum never holds, escrows, transmits, or forwards funds.

- ⦿ DocuSign contract execution — signed contract required before any release
- ⦿ Schedule of Values links contract value to individual draw milestones
- ⦿ Evidence and lien waiver attached to each draw request
- ⦿ AI Draw Control Brief pre-screens the draw package before the gate runs
- ⦿ Server-side 10-condition release gate — no UI path around it
- ⦿ Funder-triggered only. Admin oversight. Admin cannot release.
- ⦿ Stripe Connect automated rail + external/manual partner-controlled rail
- ⦿ Append-only, hash-chained audit log — every authorization recorded

Funder authorization

Funder triggers release. Admins cannot.

AI precondition

Draw review — informs; never decides.

10-condition gate

Server-side. Atomic. No UI bypass.

CORE

Execution rail

Stripe Connect or external/manual.

— THE RELEASE GATE

10 conditions. Server- enforced.

Every release evaluates all 10 conditions in a single server-side pass. All failures return together — no partial bypass, no UI shortcut. Funder-triggered only; admin accounts are explicitly rejected.

Funds cannot move unless all conditions pass.
Reservation is atomic: concurrent releases against the same balance cannot over-authorize.

Funder-triggered, system-enforced. Admins oversee operations but cannot release funds.

01 **Milestone approved**
Funder has explicitly approved the work

02 **Protection ready**
Milestone protection cleared for release

03 **Sufficient funded balance**
Available capital covers milestone + fee

04 **Payout readiness verified**
Rail-aware: Stripe payouts enabled, or external rail authorized

05 **Onboarding complete**
Contractor platform onboarding finalised

06 **No existing release**
No pending or confirmed release for this milestone

07 **No open change orders**
All change orders resolved before release

08 **Signed contract**
Fully-executed, non-voided contract on file

09 **Sequential ordering**
Prior milestones released + explicit prerequisites met

10 **Approved lien waiver**
Conditional progress lien waiver on file (when required)

— AI PRECONDITION

AI informs. The gate decides.

An AI-assisted draw review runs before the 10-condition gate. It reads documentation, flags anomalies, and produces a risk level — but it has no authority to release funds. If AI is unavailable, the gate still runs; if AI is wrong, the gate still holds.

ARCHITECTURAL BOUNDARY

AI is a **precondition**, not an **approver**. The gate runs independently in every case. A passing AI assessment does not bypass any gate condition.

- **Risk below critical**

Critical risk flags block the gate; admin review required.

- **Assessment < 48h old**

Stale reviews do not satisfy the precondition.

- **Provider fallback**

Multi-provider AI with fallback chain. Malformed responses default to critical.

- **Admin override (AAL2)**

Emergency bypass is time-boxed, audit-logged, and does not touch the gate.

See it live. Harbor Logistics.

The interactive demo walks through a complete \$2.18M draw release — Contract → DocuSign → SOV → Evidence → AI Brief → Release Gate → Funder Authorization — from three role perspectives.

Harbor Draw #3

Structural Steel Erection · \$2,180,000
10/10 conditions verified · AI score 91/100

→ **Open Harbor Demo**

Contract executed

Harbor Logistics Agreement signed by both parties via DocuSign

SOV approved

\$9.1M contract value linked across 5 milestone SOV line items

Draw linked to SOV

Draw #3 — Structural Steel Erection — \$2,180,000 tied to SOV item

Evidence + lien waiver

Inspection report, conditional lien waiver, draw request, site photo attached

AI Draw Control Brief

Perplexity AI pre-review complete — risk score 91/100, no critical flags

Release Readiness verified

All 10 gate conditions pass simultaneously on server-side evaluation

Funder authorizes

Funder reviews Authorization Signal — clicks Authorize Release

AWAITING

Audit trail

Every action recorded in hash-chained log — permanently

AWAITING

— EXECUTION RAILS

Authorization is separated from execution.

Vektrum authorizes release. Execution happens on a payment rail. Vektrum never holds or custodies funds — on either rail. On external/manual releases, funds never interact with Vektrum infrastructure at all.

AUTOMATED Stripe Connect

Funds are held in Stripe-managed accounts. Vektrum runs the gate and instructs Stripe to transfer. Stripe controls movement.

- ⌚ 10-condition gate, including Stripe payouts check
- ⌚ Atomic reservation + transfer + ledger increment
- ⌚ Billing record created on transfer confirmation
- ⌚ Reconciled hourly against Stripe API

PARTNER-CONTROLLED External / manual

Funds never touch Vektrum infrastructure at all. The funder (or their treasury, escrow, or title partner) executes payment off-platform after Vektrum authorizes.

- ✓ Same 10-condition gate (Stripe payouts check skipped)
- ✓ Authorization recorded; funder executes externally
- ✓ Confirmation records method, reference, proof, actor
- ✓ SLA-tracked; unconfirmed releases escalate

Vektrum governs authorization. Vektrum does not hold funds directly.

— WHERE VEKTRUM PLUGS IN

One layer. Two paths.

Vektrum enforces authorization between approval and execution. Your payment infrastructure — Stripe, title, escrow, treasury — remains in place. The gate is identical on both paths.

- ✓ Does not replace title or escrow
- ✓ Does not execute wires
- ✓ Existing payment rails stay in place
- ✓ Stripe Connect is one supported rail — not required

V = Vektrum layer. The gate, AI precondition, and audit log are identical on both paths.

— API ARCHITECTURE

Four layers. No bypass path.

Every release request passes through all four validation layers in sequence. A block at any layer terminates the request — no layer can be skipped by role, flag, or calling convention.

ASYNC CHANNELS

 **Reconciliation engine**
Hourly · 6 pass · SLA escalation

 **Stripe webhooks**
HMAC-verified · idempotent · failure-wins

The trust layer lives under every release.

A release is only as trustworthy as the record behind it. Vektrum writes an immutable, operationally-monitored record of every authorization, confirmation, and override.

Hash-chained audit log

Append-only. Every action. Tamper-evident chain. Admin actions dual-log with justification ≥ 20 chars.

AAL2 for privileged admin actions

Step-up MFA required for AI override, protection changes, and any admin write that could affect release eligibility.

Hourly Stripe reconciliation

Six-pass reconciliation compares DB $\leftrightarrow$ Stripe $\leftrightarrow$ ledger. Stuck-run detection. Rail-aware.

1-hour SLA escalation

Unresolved critical findings escalate past a 1-hour threshold. External-rail pending releases tracked against SLA.

Frozen-deal behaviour

If a contract is voided after releases have occurred, the deal freezes. No further release until admin review.

Sequential milestones + lien waivers

Prior-milestone ordering and conditional progress lien waivers are enforced in the gate when configured.

— ROLE SEPARATION

Funder triggers. Admin does not release.

The release gate rejects any caller whose role is not `funder`. This is a deliberate security boundary — admin compromise cannot become unauthorized disbursement.

 FUNDER CAN ✓ Fund the deal ✓ Approve milestones ✓ Trigger release ✓ Confirm external execution CANNOT ✗ Release without conditions ✗ Bypass the gate	 CONTRACTOR CAN ✓ Submit draws ✓ Upload evidence / waivers ✓ Receive payment after release CANNOT ✗ Release funds ✗ Self-approve milestones	 ADMIN CAN ✓ Oversee disputes ✓ Review audit log ✓ Manage ops ✓ Apply time-boxed overrides (AAL2) CANNOT ✗ Release funds ✗ Modify financial records silently
--	--	---

— WHAT VEKTRUM IS NOT

Category clarity.

Vektrum is release-control infrastructure — a new category that sits between draw approval and payment execution. It does not compete with, replace, or replicate any licensed financial function.

What Vektrum is:

- ✔ Conditional authorization infrastructure
- ✔ Release-control layer
- ✔ 10-condition enforcement gate
- ✔ Audit and evidence system
- ✔ Partner/API infrastructure

Not a bank

Vektrum holds no deposit accounts and issues no credit.

Not escrow

Funds are held by Stripe, title, or the partner's treasury — not Vektrum.

Not a lender

Vektrum does not originate, fund, or service loans.

Not a money transmitter

Vektrum does not receive or forward funds on behalf of others.

Not a payment processor

Stripe Connect or the partner rail processes execution — not Vektrum.

Not AI payment approval

AI pre-screens the draw package. The deterministic gate decides.

Not project management

Vektrum is not Procore. It is the enforcement layer that sits before disbursement.

Not a title replacement

Existing title and escrow partners keep their custody and closing function.

Construction finance is due for an enforcement layer.

Construction starts represent one of the largest and least-digitised credit flows in the US. The release-control layer has seen near-zero investment — until now.

Construction capital is still manual

Draw decisions move through email, spreadsheets, and PDFs. Enforcement is memory, not systems.

Private credit needs stronger release control

Non-bank construction lenders are growing and they need institutional-grade release evidence.

Payment rails are fragmented

Lenders use Stripe, existing treasury, escrow, and title. A rail-agnostic authorization layer is the high-leverage position.

WHO NEEDS THIS

Private construction lenders

Release evidence for LP reporting and diligence.

Regional + community banks

Modernise draw operations without ripping out core.

Fund managers / credit funds

Institutional-grade controls over portfolio draws.

Vertical construction platforms

Embed governance alongside existing workflow.

COMPETITIVE LANDSCAPE

Others track, manage, or execute.
Vektrum controls authorization.

Construction platforms manage workflow.
Payment processors move money. Neither enforces whether a specific release is allowed.

— BUSINESS MODEL

Priced on what moves — not on seats.

A governance fee per verified disbursement. Contractors are always free. Revenue scales with capital flow, not headcount.

1.00%

Standalone

ENTRY

Self-service. No retainer. No setup.

\$500,000 release → \$5,000 governance fee

0.70%

Institutional

RETAINER

Retainer-backed. Volume pricing.

\$500,000 release → \$3,500 governance fee

0.65%

Enterprise

CUSTOM

Negotiated annually. Integration-led.

\$500,000 release → \$3,250 governance fee

MODEL PRINCIPLES	
Mirrors billing.ts + /pricing	
Pricing model	Per-release governance fee
Minimum per release	\$50
Contractor cost	\$0 — always free
Billed to	Funder (on top of milestone)
Rail-agnostic	Stripe Connect + external/manual

— CURRENT STATE

Shipped. Running. Opening to pilot partners.

✓ **BUILT TODAY**

- Production-grade v1 infrastructure — gate, rails, reconciliation
- DocuSign contract execution (funder + contractor signing flow)
- Schedule of Values with milestone-to-SOV linking
- Evidence upload and lien waiver support per milestone
- AI Draw Control Brief — pre-review precondition before gate runs
- Stripe Connect automated rail (end-to-end)
- External / manual execution rail with confirmation + SLA tracking
- Notifications center — deal activity, release events, review alerts
- Hash-chained audit log with admin dual-logging
- Interactive public demo — Harbor Draw #3 guided story

→ **NOW**

- Seeking pilot funders + lending partners
- Investor conversations for initial round
- Design-partner program for construction lenders

No paying-customer claims are represented in this deck. Revenue begins when the first pilot funder moves a live release.

— FOUNDERS & BOARD

Built by operators who lived the problem.

Not fintech generalists. Operators from construction finance who watched the same preventable failures repeat — and built the enforcement layer they needed.

AM

Adam Morgan

CO-FOUNDER & CHIEF PRODUCT
OFFICER

- 10+ years construction project management — residential and commercial projects \$100K–\$1M+
- Owner/Operator, Morgan Renovations: full-cycle estimating, budgeting, scheduling, crew, and client relations
- Built Vektrum's technical architecture: Supabase backend, Stripe Connect, API webhooks, release gate, rail abstraction
- Self-taught software engineer; product design driven by direct construction payment enforcement experience

TW

Tanner Walstad

CO-FOUNDER & CHIEF COMMERCIAL
OFFICER

- Sales, marketing, and GTM across institutional software — Canary Speech AI, Altol Consulting, World Financial Group
- Independently built the original Vektrum marketplace concept for construction payment dispute resolution
- Accountable for commercial strategy, institutional lender partnerships, and market positioning
- Brings compliance signaling, enterprise sales cycles, and governance requirements to lender conversations

PW

Phillip Walstad

BOARD MEMBER & STRATEGIC
ADVISOR

- Serial entrepreneur — Co-Founder of Canary Speech (healthcare AI, voice biomarker technology)
- Founded / co-founded Compass Group (US + Latin America), Study&Work, Turnkey Social
- Core expertise: startup formation, fundraising, go-to-market, product development, team building
- Provides governance oversight, capital strategy, and operational guidance from multi-sector scaling experience

CLOSING

The standard release-control layer for construction capital.

We are looking for workflow validation and partner discovery with title, escrow, lending, treasury, and construction-finance operators.

The first meeting maps your current draw-release process and identifies whether Vektrum can sit before it as the release-control layer.

PILOT PARTNERS

Title, escrow, lenders,
treasury operators

PARTNER DISCOVERY

Map your draw process +
identify fit

INVESTOR CONVERSATIONS
