Better Together: Vektrum + Procore

Procore keeps the project record. Vektrum adds enforceable release governance before construction funds are disbursed.

CONDITIONAL AUTHORIZATION INFRASTRUCTURE FOR CONSTRUCTION DISBURSEMENTS

Authorization is separated from execution. Vektrum does not hold or move funds.

Procore shows what happened on the project. Vektrum enforces what must be true before the money is released.

WHO THIS IS FOR

1

Construction lenders & private-credit funds

Administering draws on projects their contractors already run in Procore — the primary buyer.

2

Owners & developers

Running fund control on Procore-managed projects.

3

Title, escrow & fund-control partners

Executing disbursements and needing verifiable authorization evidence.

WHY IT MATTERS

Enforcement, not tracking. All 10 release conditions must pass before authorization — no admin, contractor, or partner can bypass the gate.

Proof by default. Every authorization or block lands in an append-only, hash-chained, tamper-evident audit trail.

No rip-and-replace. Non-custodial and rail-neutral — keep Procore, and keep your existing payment process.

CUSTOMER CHALLENGE & JOINT SOLUTION

Vektrum evaluates draw evidence against a deterministic release gate and records provable authorization — alongside Procore as the project and cost system of record.

THE CHALLENGE

The release decision for the capital funding a project too often runs on emailed PDFs and manual sign-off, outside the project record.

Approval is not enforcement — nothing structurally stops a release when a lien waiver is missing or a change order is still open.

When auditors or LPs ask who authorized a release and on what basis, the evidence is scattered across inboxes.

THE JOINT SOLUTION

Project evidence meets enforced release conditions.

Blocked draws show exactly what's missing.

Every release carries provable authorization.

THE JOINT WORKFLOW IN 30 SECONDS

Proof recorded at every step — every pass and block lands in the tamper-evident audit trail.

When X happens on the project, Y happens before the money moves.

01

Change-order-aware draw readiness

When an open change order touches a draw's milestone, the release gate blocks that authorization until it is resolved. In the simulated joint workflow, resolving the change order at source clears the block.

GATE: LIVE IN VEKTRUM

PROCORE FEED:
SIMULATED**02**

Lien-waiver completeness before release

When the required conditional lien waiver is not yet approved, the gate blocks the draw; when the approved waiver is on file, the gate can pass and the funder can authorize.

GATE: LIVE IN VEKTRUM

PROCORE FEED:
SIMULATED**03**

Milestone isolation with execution proof

When one milestone is disputed, only that release unit is blocked — unrelated milestones keep moving. When the title or escrow partner executes, its confirmation is recorded against the signed authorization.

GATE: LIVE IN VEKTRUM

PROCORE FEED:
SIMULATED

Release-gate enforcement is live in Vektrum today. The Procore-connected workflow is demonstrated as a simulated concept; production integration is planned.

Governance outcomes you can verify — proof labeled for what it is.

QUANTIFIABLE BENEFITS

10 required conditions, zero exceptions

Every release authorization passes the full deterministic gate. (Internal product metric)

Blocked before, not disputed after

Missing waivers and open change orders stop the affected draw before funds are authorized.

Audit-ready by default

Exportable, hash-chained evidence for LP reporting, audits, and reviews.

Capital keeps moving under dispute

Milestone-level isolation blocks one release unit, not the whole project.

PROOF POINTS

ILLUSTRATIVE SCENARIO — SIMULATED WORKFLOW, FICTIONAL DATA

A \$2.18M draw on a \$42.8M project is blocked on an open change order and an unapproved lien waiver, then authorized after both resolve — with the full audit timeline recorded.

ILLUSTRATIVE SCENARIO — PUBLISHED VEKTRUM EXAMPLE, NOT CUSTOMER DATA

A \$15K dispute on a \$9M project locks one milestone — the other milestones keep releasing.

No joint-customer metrics yet — the scenarios above are illustrative and labeled; joint pilot data would replace them.

WHY WE WIN TOGETHER & WHAT'S NEXT

Purpose-built release governance

A deterministic 10-condition gate enforced in UI, API, and database — not a tracking checklist.

Complementary by design

Non-custodial and rail-neutral: adds enforcement without touching Procore's lane or the customer's payment stack.

Evidence-grade audit

Append-only, hash-chained, tamper-evident records of every pass and block.

Disciplined AI

AI-assisted pre-review flags risk; the deterministic gate decides — AI never approves a release.

FOR PARTNERS

Validate the proposed integration workflow with Procore's Technology Partner team.

Complete technical review of the sandbox connectivity now in place — OAuth against the Procore Developer Sandbox, read-only by design — and define the supported objects for the read integration.

Scope a joint design-partner pilot on a lender-funded Procore project and pursue Marketplace readiness.

FOR CUSTOMERS

Walk through the simulated joint workflow at vektrum.io/demo-live/procore.

Bring one upcoming lender-funded draw as a design-partner scenario.

Contact operations@vektrum.io to set up a working session with your lender and title/escrow partners.

No Procore Marketplace listing, certification, or endorsement exists today — next steps above are the honest path to them.
